

Innovative packaging solution for Sinkers

Special bundling of sinkers makes handling more easy in practice.

This innovative packaging gives Groz-Beckert customers active support with improving their cost-effectiveness. Less handling time directly reduces setting-up times. Inserting sinkers that are packaged in this way gives you shorter setting-up times which means you can lower your production costs considerably as compared to your competitors.

FUNCTION

The sinkers are fitted with an opening on the top of the butt. There is an elastic retainer inserted in this opening. This holds the sinker bundle safely together and makes it easy to remove the parts. Groz-Beckert has patent pending on this invention.

BENEFITS OF THE NEW PACKAGING

- The sinkers are packaged in a parallel position and do not have to be lined up in a time-consuming operation before insertion.
- Sinkers that have been removed can be easily inserted in the parts bundle again.
- This innovative kind of bundling ensures that no lateral pressure is applied on the sinker bundle, which significantly reduces the risk of sticking.
- The sinkers can be easily removed from the knitting machine for cleaning by lifting them out with the retainer. This means that the time-consuming work of lining them up again after the cleaning process is no longer necessary.
- After cleaning, the used sinkers can be stored safely until they are needed again in a knitting machine.
